And when the battery conks out, you'd think that it was time to visit the local jeweler or KMart service desk to get the battery replaced. Those teeny keys are just too small to work with, and it doesn't sync with my computer's address book. What I find handy is the calculator function, which has proven useful on many occasions. Note that this guy doesn't keep any information in his Databank either. These instructions may be incorrect. I may be making them up as I go along. I will not be held responsible for you breaking your watch because you followed some instructions someone posted on the internet. Toss aside your warranty, grab your jeweler's screwdriver, and unscrew the four tiny screws on the back. Lift the rear plate off gently so as not to disturb the waterproofing rubber gasket. Oops, too late. Well, do your best to stick it back in on reassembly. Remove the white plastic component protector gently, and you're looking at the battery. Unhook the metal retainer by pushing down and out on the retainer with your jeweler's screwdriver, and the retainer will pop loose from over the plastic catch. To clarify you are unhooking the metal retainer from where the plastic catch is holding it in place. This is a delicate operation; don't push too hard or you'll ruin the retainer. Then remove the CR2016 battery and replace it with a new one. I'll say this as politely as I can: I've shared these instructions with you freely. I've posted as much as I know. Please do not contact me to ask questions about Databank watches. Thanks! Any chance you could do a quick short video to demonstrate this motion I am thankful for not having to go to a jeweler! Cheers to the Databank 150 community! It took me a while, but it worked. The original post has a good picture to identify which end of the retaining clip will pop out open and which end acts like a hinge please leave this end alone. My smallest jewellery screwdriver blade was still too wide to fit into the

tiny square hole. <http://accessiblevehicleservices.com/userfiles/bt5100-manual.xml>

Using a pushpin, which is the right length and strength for the job, insert end into the square hole in the plastic part that sticks out. Push the upper part of the pin back towards the body, gently. This causes the plastic part to push on the clip which springs loose and pops out. Replace the battery, using your fingers and orienting the battery correctly. Do not use metal tweezers as you will short out the battery. Now to reengage the retaining clip, press clip down with your finger and use a very small slothead jewelers screw driver to push the horizontal part of the retaining clip under the plastic part so the retaining clip will hold the battery down. Good luck I didn't seem to have trouble following your instructions down being well down, and out being away from the battery. I appreciate your post. I will not be suing you. Everything else works. There's just NO sound such as when I set the alarm. Also, would anyone know where I can locate a diagram of the internal structures of this Casio watch. Any help would be appreciated. There needs to be some electrical connection to the crystal beyond the back itself, so there is often a coil of leaf spring or two to make that connection. Maybe that went south during the battery replacement. Just a general observation. It must make a contact with the metal cover. I replaced my battery and when I did, a spring fell out. I looked all over the internet, then wrote Casio, who said they didn't have access to the information about where the spring went. Doh! I got a used DB35H from my brother and was going to swap the innards when I noticed the spring on his. Put my spring back and it beeps. If you've lost the spring, don't know if you can fake it with tinfoil or not, but it really is a TINY spring. Good luck. If you put the back on turned 180 deg from where it was, the beep will not work. Take the back off and turn it around so that the spring can contact the metal part of the back, not the insulated part.

Then the beep should work. YMMV. They should make the screw positions asymmetrical so this mistake cannot be made. A lot of questions can be answered by looking at the manual. It is what makes the beeping sound. If you're working on the watch, and turn it upside down to see the watch face, you can lose this spring. I think a watch place could easily replace it. Then I searched the web for 15 minutes before I found your page. THANK YOU! You saved my watch. Dave Does anyone know where I can either get a replacement spring OR what I can use to substitute it so that the alarm will work again. I use the alarm to remind me to take medication and keep missing my scheduled times without it and I'd hate to replace the watch because of a spring. I've worn out a lot of Casio Databanks in the past couple decades usually the case or the band breaks. Now I have a reason to keep the old ones for their springs. Go to calculator mode, then press the Set button in the upper left to toggle. All of which worked when the retainer flange nice word that holding the battery let go with a satisfying pop and the battery flew out. No plastic tweezers, no little springs stuck to the ceiling, no connecting positive to negative. Popped in the battery, popped on the back and hey presto. Anyone want to know the time Oh and thank you. Be brave mon braves. I couldn't go a day without it. I know. I need to get a life. I have a life and it's run by this watch. Thanks a million for the instructions. I just had a jeweler replace the battery. My husband is very mechanical a guitar maker. If I can find the battery cheap, he can replace it next time. The jeweler did give me a five year warranty so if you think about it the battery didn't cost that much. Thanks. This strip is meant to contact the back of the watch, where the crystals that Rich mentioned are bonded to the back. You can see the spring flap along the corner directly left of the yellow arrow in the picture.

I imagine that if you depress this a bit so that it doesn't poke all the way through to the back, then your watch will no longer beep including the alarm. I've had this watch for over 10 years and never changed the battery until now. The battery I found inside was a Li 3 volt Sony CR2016. I replace the batteries myself in all my other watches, but couldn't do this one. Thank you thank you thank you! Wish I had found this website first, because it would've saved me about 20 minutes. The time is displayed in the lower area. Any ideas why this is happening The store owner was afraid he'd cooked my watch and didn't charge for the new battery. Meanwhile, I had a useless joke with Open and the

wrong time on my wrist for the rest of the day. I cleaned the contact points on the piezo crystal and case interior where the finger and spiral springs make contact and performed the AC jumper connect again. I turned the plastic inner shell so the slot allowed the finger spring to stick up and reassembled the case again. No joy. Open would not go away despite several attempts to repeat and reseal the works. Much to my surprise the watch sprang back into near normal operation. Fearing the loss of the radio, I manually set the time and went to bed. The next morning I checked and saw the little sat dish icon indicating that it had successfully performed an automatic update that night. Whew! I'm still not certain why the Open message was so hard to overcome but my gut feeling is that the plastic inner shell may be the part requiring precise alignment before replacing the back cover. In any case, I've decided to leave well enough alone as it seems fine as is. Once activated, the daily alarm will continue to do so unless turned off by the Receive button in alarm mode. Attempting to replace the plastic inner cover only brought back the Open message. This inner cover has two holes a slot and a round hole.

On my post-battery replaced watch, two tiny coiled springs stick up from the watch inner frame a steel spring that protrudes through the round hole and a copper spring that is apparently compressed by the plastic cover. The copper spring makes contact with one end of this strip, but it is the only point of contact. It seems that this strip is actually an electrical bridge that is intended to complete a vital circuit and that by taking out the plastic cover the copper spring makes contact with the case and allows the watch to exit Open mode and appear to function. This was confirmed by jumpering the copper spring to the adjacent steel structure covering the frame and seeing Open revert to the correct time again. Looking closely at the mount points on the watch frame, I see that the steel and copper springs both have a slightly elevated circle in the white polyethylene plastic and that there is another empty hole where a matching spring would make contact with the other end of the brass strip. When bridged in this manner, the watch returned to normal time mode and more importantly allows switching to alarm mode and changing of the alarm function via the Receive button. I am fairly sure that this also would allow the Receive button to either display the last update time or initiate an update if held in. Your information helped to solve the problem. As for the springs; I found that a single strand from a speaker wire wrapped around a .020 bit of safety wire made a nice replacement spring. Had to work under a magnifying lamp to see it I now have my trusty databank back in action! Replacing the battery myself was much more economical than paying 4X the cost of a battery to have someone else do it. I performed the AC procedure, and wonder what this is intended to do since there was no response from the watch. There is a little hole with a contact down in there by the AC mark on the retainer ring.

Are these points supposed to be jumpered for 2 seconds I can't get in the alarm mode, or anything else. Thanks for any help, Chuck. Odds are you won't even see the spring it's so tiny, but the alarm won't work without it. I substituted a very tiny snip of wire down in the hole where the spring goes and VIOLA. Cleaned up the connections on the copper bridge on the cover, made sure the tap was making contact with the cover through the plastic deal. Had to put a pin down into that little hole and try to connect with the retainer ring. Is that right? Before the battery was all the way out, I slid the new one carefully underneath. It worked for me, maybe it will work for you. Good luck, watch is still working. Before the battery was all the way out, I slid the new one carefully underneath. It worked for me, maybe it will work for you. Good luck, watch is still working. My DH had taken his Casio watch to WalMart where we had purchased it to get the battery replaced. Couldn't, didn't, etc. I called to ask WM some information and was told Casio won't let them replace batteries our Target doesn't even sell watch batteries, any longer. Also, I was told that the WM clerk should have given him a box, so he could send it back to Casio. Following your photo and directions, he was then able to easily replace the battery. His watch hadn't quit running; but, the alarm had ceased working and the light no longer worked. Again, thanks for sharing! I just brushed the piezometer on the metallic cover of the watch with metallic wool it was grey after more than 20 years of oxidizing., and the

watch beeps now as a charm ! I found it hard to believe as it was working properly till the battery ran out. I would like to thank all the people who have contributed to this page and the person who started it. I have got my watch to work again but the backlight is not working. Any ideas about what could be wrong.

I tried the AC jumper thingy but havent really understood how to do it, yet since my watch started working after my trial and error approach i didnt do anything else. I would appreciate any help regarding this, thanks in anticipation, Centaur. The solution is. you can only narrow it down to say a few. In a classic case of psychology gone wild, we all understand what you think your world is like if youre in deep sleep. You are aware of your surroundings, the tiniest details but not overwhelmed by them. However, when youre awake, there is an atmosphere of mystery and worry about you. You find it hard to comprehend others because you cant find yourself in the midst of the conversation and therefore can not affirm your own words and ideas. As humans, we have the habit of linking things along with the ideathis must be linkedthat has to be connectedthese two needs to be connected. We simply dont know our environment. We cant see where were moving. We do not understand what we are doing. It is this feeling of unknowing that draws us towards something which seems mysterious. This phenomenon is why we bond together with people we see everyday. This may be a huge issue for many of us when we are dealing with relationships and love. We do not understand how we look at things and consequently do not understand how to tell when the other individual is being sincere when they say I love you. The words just flow out of our mouths, often without us having any idea how these words relate to each other. We cant even tell if we are doing it right. This is because there is no objective test that allows us to say These are the actions of a true lover. So, we just feel that were in love and nothing else matters. And our feelings remain unbound till we happen to meet someone whos not in love. You can state that the entire concept of love is a work in progress and that no one can ever establish its validity.

But all too often people do not heed this warning and fall in love and live together with someone they know nothing about. How sad it is when you can not even learn the basic tenets of authentic love!
